

The Yin transducer

The Yin transducer has a protective function. It has been programmed to protect you from any type of nuisance and maximize your potential for health and well-being. It re-harmonizes, strengthens and revitalizes all the biological systems of living things.

Its effectiveness can be easily observed on any type of plants within its range.

1. The lemon tree

Within 3 weeks, the lemon tree developed and a new branch appeared clearly distinguishable from the leaves already present when the plant was purchased.

2. The fir tree

Without any protection, a fir tree quickly loses its thorns (10 days after cutting the tree, the process is initiated. It then takes three days for the fir to begin to lose its thorns).

Placed near the Yin transducer, this fir tree remained intact for over a month.
